GENERAL

volume of a triangular prism worksheet

Published: September 3, 2026 | Index ID: #-

Introduction

When students first encounter three dimensional geometry, the concept of a triangular prism often stands out as a bridge between the familiar two dimensional triangle and more complex solids. Teachers and tutors frequently turn to **volume of a triangular prism worksheet**as a practical tool to reinforce the formula, promote problem solving skills, and build confidence in measuring space. In this article, we dive deep into the world of triangular prisms, explore how to calculate their volume, and provide a wealth of worksheet ideas, step by step solutions, and teaching strategies. Whether you're a classroom instructor, a homeschooling parent, or a student looking for extra practice, this guide will equip you with everything you need to master the topic.

Understanding Triangular Prism Volume

What Is a Triangular Prism?

A triangular prism is a polyhedron that has two congruent triangular bases connected by three rectangular faces. The shape looks like a stretched or elongated triangle, with the rectangular faces serving as the sides that "bridge" the two bases. Triangular prisms come in many real world applications—from architectural beams to packaging boxes.

Why Volume Matters

Volume tells us how much space a solid occupies. For engineers, architects, and designers, knowing the volume of a triangular prism can inform material usage, load calculations, and manufacturing costs. For students, mastering volume calculations strengthens spatial reasoning, algebraic manipulation, and geometric intuition.

Key Takeaway

In a triangular prism, the volume is the product of the area of one triangular base and the prism's length (the perpendicular distance between the two bases). This simple relationship lies at the heart of every **volume of a triangular prism worksheet** you'll encounter.

Triangular Prism Volume Formula

Deriving the Formula

Let's break down the formula step by step:

1. Area of the triangular base (A): If the triangle has base \\(b\\) and height \\(h\\), its area is \\(\\frac{1}{2} \\times b \\times h\\).
2. Length of the prism (L): This is the distance between the two triangular bases.
3. Volume (V): Multiply the base area by the length: \\(V = A \\times L\\).

So, the final equation looks like this:

V = (1/2) × b × h × L

When the Base Is Not a Right Triangle

If the triangular base is not a right triangle, you can still find its area using the **Heron's formula** or by splitting it into two right triangles. The volume calculation remains the same once you have the base area.

Quick Reference Table

- Right angled triangle: $A = \frac{1}{2}bh$
- Isosceles triangle: $A = \frac{1}{4}\sqrt{4a^2 - b^2} \times b$ (where a is the equal side and b is the base)
- General triangle (Heron's): $A = \sqrt{s(s-a)(s-b)(s-c)}$ where $s = \frac{a+b+c}{2}$

Step by Step: Solving Volume Problems

Example 1: A Simple Right Angled Prism

Given a triangular prism with a right angled base where the base of the triangle is 6 cm, the height of the triangle is 8 /cm, and the length of the prism is 10 /cm, find the volume.

1. Compute the base area: $A = \frac{1}{2} \times 6 \times 8 = 24\,\text{cm}^2$.
2. Multiply by the length: $V = 24 \times 10 = 240\,\text{cm}^3$.

The volume of the prism is **240 cubic centimeters**.

Example 2: A Prism with an Isosceles Base

Suppose the base is an isosceles triangle with sides 5 /cm, 5 /cm, and 8 /cm, and the prism's length is 12 /cm.

1. Find the base area using Heron's formula:

   Semi perimeter: $s = \frac{5+5+8}{2} = 9$ /cm.
2. Area: $A = \sqrt{9(9-5)(9-5)(9-8)} = \sqrt{9 \times 4 \times 4 \times 1} = \sqrt{144} = 12\,\text{cm}^2$.

Answer: **144 cubic centimeters**.

Example 3: Using a Non Right Base with Known Height

Consider a triangular prism where the base is a 3 6 7 triangle (sides 3 /cm, 6 /cm, 7 /cm) and the prism's length is 9 /cm.

1. Calculate the base area:

   Semi perimeter: $s = \frac{3+6+7}{2} = 8$ /cm.
2. Area: $A = \sqrt{8(8-3)(8-6)(8-7)} = \sqrt{8 \times 5 \times 2 \times 1} = \sqrt{80} \approx 8.944\,\text{cm}^2$.

Rounded to one decimal place, the volume is **80.5 cubic centimeters**.

Triangular Prism Worksheet Ideas

Creating engaging worksheets is essential for reinforcing concepts. Below are a variety of worksheet types that cater to different learning levels and objectives.

1. Basic Calculation Worksheets

- Problems with right angled triangular bases.
- Single step volume calculations.
- Multiple choice questions for quick assessment.

2. Mixed Method Worksheets

- Combination of right angled, isosceles, and scalene triangles.
- Problems that require students to identify the correct formula based on the base shape.
- Inclusion of word problems that relate to real world scenarios.

3. Advanced Problem Solving Worksheets

- Use of Heron's formula for non right triangles.
- Questions that involve variable dimensions (e.g., "If the length of the prism increases by 5 /cm, what happens to the volume?").
- Multi step problems requiring algebraic manipulation.

4. Visual and Interactive Worksheets

- 3D diagrams with labeled dimensions.
- Color coding to differentiate base, height, and length.
- Interactive PDFs where students can drag and drop values.

5. Assessment & Review Worksheets

- Summative tests with a mix of difficulty levels.
- Self graded worksheets with answer keys.
- Progress tracking charts for teachers.

Step by Step Solutions for Sample Worksheets

Below is a detailed solution for a representative problem set that covers the spectrum of difficulty levels.

Sample Problem Set

1. A right angled triangular prism has a base of 4 /cm, a height of 9 /cm, and a length of 15 /cm. Find its volume.
2. The base is an isosceles triangle with sides 6 /cm, 6 /cm, and 8 /cm; the prism's length is 20 /cm. Find the volume.
3. A prism's base is a 5 12 13 triangle. The length of the prism is 18 /cm. Compute the volume.
4. In a word problem: "A shipping box shaped like a triangular prism has a triangular base with a base of 10 /cm and a height of 12 /cm. If the box is 25 /cm long, how many cubic centimeters of space does it hold?"

Solution Breakdown

1. Problem 1:

   Base area: $A = \frac{1}{2} \times 4 \times 9 = 18\,\text{cm}^2$.
2. Volume: $V = 18 \times 15 = 270\,\text{cm}^3$.

- Use Heron's formula: $s = \frac{6+6+8}{2} = 10$ /cm.
- Area: $A = \sqrt{10(10-6)(10-6)(10-8)} = \sqrt{10 \times 4 \times 4 \times 2} = \sqrt{320} \approx 17.89\,\text{cm}^2$.
- Volume: $V \approx 17.89 \times 20 \approx 357.8\,\text{cm}^3$.

- Right angled triangle, base = 5 /cm, height = 12 /cm.
- Area: $A = \frac{1}{2} \times 5 \times 12 = 30\,\text{cm}^2$.
- Volume: $V = 30 \times 18 = 540\,\text{cm}^3$.

- Base area: $A = \frac{1}{2} \times 10 \times 12 = 60\,\text{cm}^2$.
- Volume: $V = 60 \times 25 = 1500\,\text{cm}^3$.

Tips for Students

- Identify the Triangle Type: Knowing whether the base is right angled, isosceles, or scalene determines the

area formula you'll use.

- Check Units: Keep track of centimeters (or meters) throughout the calculation to avoid unit errors.
- Sketch the Prism: A quick diagram helps visualize dimensions and relationships.
